

MyLoo

Privacy-first digestion tracker with AI Bristol classification and 30-day clinic export.

What it is

MyLoo is a digestion and stool tracker for iOS (Android launch on hold due to Google's Health Policy 2026). Photo of the sample, Claude Vision AI classifies on the Bristol Stool Scale 1-7, plus volume / texture / blood / mucus flags. Privacy-first: photos are NOT stored on our side, only the structured result lives in the timeline. The timeline carries symptom tags (bloating, cramps, urgency, pain level), and the user exports a clean 30-day PDF for their GI appointment.

Who it is for

Adults dealing with IBS, IBD, gut sensitivities, food intolerances, post-surgical follow-up. Plus parents tracking toddler health (adult-audience targeting only for now), and chronic-condition patients (coeliac etc.). Creator archetypes that convert well: gut-health educators with real lived experience, IBS day-in-the-life creators, low-FODMAP food channels, post-gastro-surgery journals, patient-advocate IBS/IBD pages, medical-professional accounts (nurses, dieticians, GI nurses) operating in a personal capacity.

Key features

- Photo-to-Bristol AI classification: Vision model returns Bristol 1-7 + volume / texture / blood / mucus flags from a single photo.
- Privacy-first photo handling: image is processed in the Vision call and not persisted on Klar infrastructure, only structured result lives in timeline.
- Symptom tags timeline: bloating, cramps, urgency, pain level on a simple scale, cross-tagged with food entries.
- 30-day clinic PDF export: handed to GI at appointment, replaces 4 weeks of retrospective recall.
- Email-inbound parsing mode (Premium): off / warranty-only / all - parses incoming lab or food-sensitivity test PDFs into the timeline.
- Discreet clinical UI: deliberately calm visual identity, not the wellness-influencer aesthetic that drives away patients with real conditions.

Business model

- Single revenue stream: recurring Premium subscription.
- Free tier: manual Bristol entry + tags, timeline, manual PDF export - useful enough alone.
- Premium unlocks: AI photo classification, email-inbound scanning, extended clinic export mode.
- Free Lifetime Premium for onboarded affiliates, no posting obligation.
- Platform note: iOS only currently. Android paused since Jan 2026 - Google's Health Policy now requires registered org account + D-U-N-S verification, personal accounts are blocked at policy review. Affiliate work is iOS-focused while we resolve the corporate-account path.

Pricing

- 4.99 USD / month.
- 29.99 USD / year (~ half off vs monthly).
- iOS only currently; affiliate share is always 50% of the then-current price.

Market gap - what was missing

IBS and IBD patients track their symptoms in Word docs, Notes apps, or notebooks. That is the actual baseline - surveys consistently find that 70-80% of patients arrive at GI appointments with no structured data. The wellness-influencer-flavoured apps in the App Store (Cara Care, Bowelle, Poop Tracker) are designed for the algorithm rather than the patient: bright colours, social features, gamification. Patients with real conditions describe these as 'cringe' or 'patronising' and abandon them. Meanwhile clinical-grade tools (Cara's clinical fork, Sentinel) live behind clinic walls and require referrals. MyLoo fills the gap: clinical visual identity, AI photo classification (the time-saver), 30-day GI-ready PDF export. The privacy-first photo handling (images never persisted) is the trust unlock that lets patients actually submit photos.

Why now

Two shifts make MyLoo possible in 2026. First, Vision LLM costs dropped enough that classifying a Bristol photo at 0.01-0.02 USD per call is economically viable inside a 5 USD/month price point. Second, the privacy-first architecture (photos never persisted) is now table-stakes expectation in health apps post-2024 European Health Data Space regulations and US state-level health-data laws. Apps that store medical photos are increasingly liable and increasingly distrusted. MyLoo's no-persist design isn't just nice-to-have - it's the only way this works for a small operator without HIPAA-scale infrastructure.

Affiliate compensation

- 50% of net Premium subscription revenue for 24 months from each attributed user's first paid month.
- 30-day refund holdback before payout becomes claimable (Apple / Google refund window).
- 50 EUR minimum payout, monthly, via Wise.
- Free Lifetime Premium for onboarded affiliates (no posting obligation).
- Per-handle dashboard with live click / install / sub / earning split, no agency layer.

How tracking works - DIY attribution stack

Most affiliate stacks ride on top of Branch.io, AppsFlyer or a similar paid attribution SDK. We built our own. Those tools charge per attributed install, they add a third party to the user's first-launch experience, and they make influencer payouts opaque. Health-app users in particular are sensitive to first-launch SDK chatter - every extra vendor reading device context erodes trust. Here is what runs in each stage.

Why we built our own instead of Branch.io

Three reasons. (1) Cost: paid SDKs absorb 8-12% of the affiliate payout pool. (2) Privacy: health-app users specifically distrust apps that add tracking SDKs - and we read first-launch context as little as possible by design. (3) Transparency: when a number looks wrong, we read our own code in 10 minutes instead of debugging a vendor black box. The trade-off is we own the bugs. Every line of attribution code is in our repo.

Android: Google Play install-referrer

Android attribution via Play Install Referrer API is implemented and tested, but Android is currently paused for MyLoo: Google's Health Policy (2026 update) requires a registered organisation account with D-U-N-S verification for any app handling personal health data. We are working through that path; affiliates can expect Android to come back online once the corporate-account migration finishes. Meanwhile your link still works for Android users - they hit a landing page that explains the iOS-only status and a waitlist signup.

iOS warm (app already installed)

If the user already has MyLoo installed, iOS routes the tap through a Universal Link directly into the app with the handle in the URL path. We register `myloo.org/i/*` as a Universal Link, Apple's CDN serves the `apple-app-site-association` JSON, the OS routes the tap. Deep-link handler reads the URL path, extracts the handle, writes the attribution row.

iOS cold (~99% of creator traffic)

The hard case - and ~99% of creator traffic for MyLoo since it's iOS-only - is iOS cold install. iOS gives the freshly installed app no context. Branch.io's whole business is solving this with device-fingerprinting heuristics that became unreliable after iOS 14.5. We do it differently. When a user taps your link in Safari, our redirect chain hits `myloo.org/i/[handle]`. That page writes a short-lived JSON token to the clipboard (handle, timestamp, app-key, HMAC-SHA256 signature) before redirecting to the App Store. After install, on first launch, the app reads the clipboard once, parses the JSON, verifies the signature, accepts the token if fresh and signed, and writes the attribution row. The user sees no extra screen when it works.

Optional first-open confirmer

Optional fallback. On first open, after we've read whatever the clipboard provided, the app can show a single confirmation: "Invited by @[suggested-handle]? Yes / No". MyLoo runs the confirmer OFF currently - the clinical-calm onboarding philosophy avoids any extra screen, and the clipboard hit-rate has been high enough that the confirmer would mostly fire on edge cases we accept as missed attribution. This is a per-app config toggle we can revisit if the loss rate becomes meaningful.

RevenueCat webhook -> payout queue

Premium purchases flow through RevenueCat. RC handles Apple StoreKit receipts, dedup, refund detection, and converts everything into a consistent webhook event format. When `INITIAL_PURCHASE`, `RENEWAL`, `PRODUCT_CHANGE`, or `CANCELLATION` fires, RC posts JSON to our Supabase Edge function `affiliate-rc-webhook`. The function: (1) verifies RC signature, (2) idempotency-check, (3) looks up the user's attribution row, (4) computes 50% of net after Apple's 15-30% cut, (5) credits `affiliate_earnings` with handle, app, gross, cut, net, our-share, holdback-until, source event ID.

Holdback -> batch -> Wise

Each credited earning enters a 30-day refund holdback (Apple refund window). After holdback expires the row flips to `claimable`. A `pg_cron` job runs `build_payout_batch()` on the 5th of each month: groups claimable rows per affiliate, applies the 50 EUR minimum, creates a batch row per affiliate, enqueues to `wise_dispatch_queue`. `wise-dispatch` calls Wise's v3 transfer API with the affiliate's stored Wise recipient ID. Health-app users sometimes refund post-purchase if they didn't realise it required Premium for AI classification - those are handled cleanly via negative-adjustment rows.

What you see on your dashboard

Your dashboard at getklar.org/dashboard shows the funnel transparently: clicks per day/week/month, install split (iOS warm / iOS cold; Android paused indicator), active Premium subs in your bucket, claimable USD, paid USD, refund-holdback pipeline as a time-series, next payout date, per-app earnings funnel. If a number looks wrong, message us with details and we can show you the exact webhook payload and matching attribution row.

Why this works as an affiliate pitch

Gut-health content has explosive engagement on TikTok and Instagram, and the audience is genuinely seeking and willing to try new tools. MyLoo's clinical-calm visual identity is a real differentiator from the wellness-influencer aesthetic that dominates the category and feels untrustworthy to people with real conditions. AI Bristol classification is a feature most competitors do not have, which gives creators a concrete demo moment. Word-doc tracking is the reality for ~80% of IBS patients today - MyLoo solves exactly that switch.
