

MyLoo

Privacy-first digestion tracker with AI Bristol classification and 30-day clinic export.

What it is

MyLoo is a digestion and stool tracker for iOS (Android launch on hold due to Google's Health Policy 2026). Photo of the sample, Claude Vision AI classifies on the Bristol Stool Scale 1-7, plus volume / texture / blood / mucus flags. Privacy-first: photos are NOT stored on our side, only the structured result lives in the timeline. The timeline carries symptom tags (bloating, cramps, urgency, pain level), and the user exports a clean 30-day PDF for their GI appointment.

Who it is for

Adults dealing with IBS, IBD, gut sensitivities, food intolerances, post-surgical follow-up. Parents tracking toddler health (adult-audience targeting only). Chronic-condition patients (coeliac etc.). Creator archetypes that convert well: gut-health educators with real lived experience, IBS day-in-the-life creators, low-FODMAP food channels, post-gastro-surgery journals, patient-advocate IBS/IBD pages, medical-professional accounts (nurses, dieticians) in personal capacity.

Key features

- Photo-to-Bristol AI classification: Vision returns Bristol 1-7 + volume/texture/blood/mucus flags.
- Privacy-first photo handling: image processed in Vision call, not persisted on Klar infrastructure.
- Symptom tags timeline: bloating, cramps, urgency, pain level on simple scale, cross-tagged with food.
- 30-day clinic PDF export: handed to GI at appointment, replaces 4 weeks of recall.
- Email-inbound parsing (Premium): parses lab or food-sensitivity test PDFs into the timeline.
- Discreet clinical UI: deliberately calm, not the wellness-influencer aesthetic.

Business model

- Single revenue stream: recurring Premium subscription.
- Free tier: manual Bristol entry + tags, timeline, manual PDF export - useful enough alone.
- Premium unlocks: AI photo classification, email-inbound scanning, extended clinic export.
- Free Lifetime Premium for onboarded affiliates.
- Platform: iOS only. Android paused - Google's Health Policy 2026 requires registered org + D-U-N-S.

Pricing

- 4.99 USD / month.
- 29.99 USD / year (~ half off vs monthly).
- iOS only currently; affiliate share is 50% of the then-current price.

Market gap - what was missing

IBS and IBD patients track their symptoms in Word docs, Notes apps, or notebooks. That is the baseline - surveys consistently find 70-80% of patients arrive at GI appointments with no structured data. The wellness-influencer-flavoured apps (Cara Care, Bowelle, Poop Tracker) are designed for the algorithm rather than the patient: bright colours, social features, gamification. Patients with real conditions describe these as cringe or patronising and abandon them. Meanwhile clinical-grade tools (Cara's clinical fork, Sentinel) live behind clinic walls. MyLoo fills the gap: clinical visual identity, AI photo classification (the time-saver), 30-day GI-ready PDF export. Privacy-first photo handling (images never persisted) is the trust unlock.

Why now

Two shifts make MyLoo possible in 2026. First, Vision LLM costs dropped enough that classifying a Bristol photo at 0.01-0.02 USD per call is economically viable inside a 5 USD/month price point. Second, the privacy-first architecture (photos never persisted) is now table-stakes expectation in health apps post-2024 European Health Data Space regulations and US state-level health-data laws.

Affiliate compensation

- 50% of net Premium subscription revenue for 24 months from each attributed user's first paid month.
- 30-day refund holdback before payout becomes claimable (Apple / Google refund window).
- 50 EUR minimum payout, monthly, via Wise.
- Free Lifetime Premium for onboarded affiliates (no posting obligation).
- Per-handle dashboard with live click / install / sub / earning split, no agency layer.

How tracking works - DIY attribution stack

Most affiliate stacks ride on top of Branch.io, AppsFlyer or a similar paid attribution SDK. We built our own. Those tools charge per attributed install, they add a third party to the user's first-launch experience, and they make influencer payouts opaque. We wanted full control of every step from click to Wise transfer. The full path has six stages - link click, install, first launch attribution, Premium purchase, holdback, payout. Here is what runs in each stage.

Why we built our own instead of Branch.io

Three reasons. (1) Cost: Branch.io and AppsFlyer charge 0.20-0.40 USD per attributed install at our volume tier, which would have absorbed roughly 8-12% of the affiliate payout pool. With DIY we keep that for affiliates. (2) Privacy: each additional SDK reads first-launch context - that is another vendor with first-touch user data we did not want to add. Apple's App Tracking Transparency framework has also made probabilistic fingerprinting unreliable since iOS 14.5; the paid SDKs work around this with opaque heuristics that we could not audit. (3) Transparency: when a dashboard number looks wrong, we read our own code in 10 minutes instead of debugging a third-party black box. The trade-off is that we own the bugs. Every line of attribution code is in our repo.

Android: Google Play install-referrer

Android gives us the cleanest path. When a user taps your link, the Google Play Store install carries the original referrer string (a URL-encoded query parameter from the redirect chain) through to first launch via the Play Install Referrer API. On first launch the app reads `getInstallReferrer().getInstallReferrer()`, we parse the handle and source out of it, and write an attribution row in our Supabase table alongside the install event. Deterministic. No fingerprinting. No clipboard.

getklar.org

iOS warm (app already installed)

If the user already has MyLoo installed, iOS routes the tap through a Universal Link directly into the app with

Why this works as an affiliate pitch

Gut-health content has explosive engagement on TikTok and Instagram, and the audience is genuinely seeking and willing to try new tools. MyLoo's clinical-calm visual identity is a real differentiator from the wellness-influencer aesthetic that dominates and feels untrustworthy to people with real conditions. AI Bristol classification is a feature most competitors do not have. Word-doc tracking is the reality for ~80% of IBS patients - MyLoo solves exactly that switch.
